Risk Insights & Recommendations

Key patterns identified across applicant and credit behaviour

Risk Insights

Younger applicants show higher payment difficulty

Payment difficulty is highest among the youngest age groups in the portfolio.

Cash loans show higher payment difficulty

Cash loans have a higher observed payment difficulty rate than revolving loans.

Previous application behaviour provides additional context

Historical approvals and refusals can provide additional context when evaluating current applicants.

Business Recommendations

01. Segment-based risk monitoring

Monitor applicant segments with consistently higher payment difficulty rates, particularly younger age groups, rather than relying solely on portfolio-wide averages.

02. Credit exposure review

Consider additional assessment when requested credit is high relative to reported income, especially when combined with other elevated-risk indicators.

03. Use historical behaviour as a supporting signal

Incorporate previous application outcomes as one contextual factor alongside current applicant characteristics rather than treating historical refusal as a standalone decision rule.

Note: Findings are descriptive and based on observed patterns in the dataset. They indicate associations, not causation, and should be combined with broader credit-risk assessment before business decisions are made.
